

A **runtime environment** for executing JavaScript code

Odemy

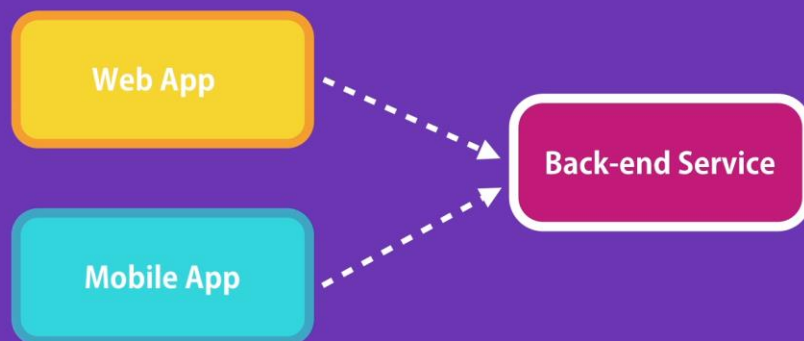

Node is open source and cross platform runtime environment for executing JavaScript code outside the browser.

We often use Node to
build back-end services

Odemy

Application Programming Interface

Udemy

Udemy

Quite often we use node to build backend services like APIs. These are the services that power the client applications like web apps running in the browsers and mobile apps running in the mobile devices. These client apps need to talk with some services on the server or on the cloud to store data, send emails, push notifications etc.

Highly-scalable, data-intensive and real-time apps

Udemy

Node is ideal for building highly scalable, data intensive and real time backend services.

Great for prototyping and agile development

Superfast and highly scalable

JavaScript everywhere

Cleaner and more consistent codebase

Large ecosystem of open-source libs
